Executive Summary

Introduction and Background

San Ramon Valley Unified School District has contracted with MGT to develop and analyze demographic data relevant to the district's facility planning efforts. The scope of contracted work includes updating district mapping files, analyzing the district using the previous four years of geocoded student data files, developing, and researching pertinent demographic data in and around the district, identifying current and future residential development plans and preparing a ten-year student population forecast.

The purpose of this report is to identify and inform the district of the demographic trends occurring within the community, how these trends may affect future student populations, and to assist in illustrating facility adjustments that may be necessary to accommodate the potential student population shifts, to assist the district in evaluating future site requirements and the need for potential attendance area changes.

MGT, a non-biased third-party consultant, has been contracted to prepare and maintain a ten-year demographic study. In this study, MGT produced detailed neighborhood and attendance area population forecasts based on the residential address of students. MGT bases its forecasts on the belief that school facility planning is more accurate when facilities are located where the greatest number of students reside. This study is intended to help the district notice specific demographic trends that could assist them in making informed decisions regarding long-range planning efforts.

The Data Sources section details how the two sources of data – geographic and non-geographic -- are collected and used in the ten-year student population forecast model.

The Forecast Methodology section discusses, in detail, how the factors used in the study were calculated, and why they were used. These factors include area birthrates and their effect on incoming kindergarten classes, the effects of student mobility, student yield factors based on historic housing data and trends, and a detailed review of future residential development within the district.

The Student Resident Forecast Summary sections offer a review of this year's student resident forecast results. These sections include the district-wide student population forecast summary and a forecasted resident student population summary for both the existing attendance areas and the individual study areas from which they were calculated.

The Enrollment Forecast section provides a 10-year projection of attendance at each school, by grade. These projections are developed by applying a pattern of transfers (in and out of a school) to the student resident forecast. Because these projections normalize policy and program choice, changes to either can greatly affect the overall trend and hence should be interpreted with those variables in mind.

While reading this report, it is important to remember that it is based on data gathered at the time of the study. Due to potential population shifts, changes in development plans, fluctuating funding opportunities, and district priorities, all findings presented in this report are subject to change.

Key Items in the District-Wide Analysis:

- Districtwide enrollment is projected to decline by about 16% over 10 years, from ~27,800 students in 2025 to ~23,300 in 2035.
- Birthrates continue to trend downward, reducing future kindergarten class sizes despite relatively stable short-term TK/K numbers
- Smaller incoming cohorts will gradually replace larger outgoing classes, accelerating decline at upper grade levels
- TK–5 enrollment steadily decreases, falling from 11,427 (2025) to approximately 9,912 (2035)
- Middle school enrollment also contracts significantly, dropping from 6,607 to about 5,246 over the decade
- High school enrollment experiences the largest numerical decline, falling from 9,771 to roughly 8,152 by 2035
- Planned residential projects (~5,006 units) will add new students, especially in areas with single-family housing, offsetting declining birth and enrollment trends. District-wide, most of the units consist of multifamily and transit-oriented developments. The number of units due to get built and occupied is not enough to offset the forecasted decline in resident student population district wide.
- Single-family detached homes yield the highest student counts (0.31 K–6 per unit), while TOD housing yields far fewer students, shaping localized enrollment trends.
- Mobility: Some attendance areas show consistent net gains (e.g., Bella Vista ES with strong K–1 mobility at 1.16), while others show slight attrition (e.g., Twin Creeks ES with 6–7 mobility at 0.93).
- Mobility: Grades K-9 see overall gains as these class cohorts graduate from one grade to the next. Grades 10-12 see some declines as class cohorts graduate from one grade to the next.
- Capture rate of births to incoming kindergarten classes remains high. There is a higher influx of kindergarten enrollment than births in the area. However, not enough to offset the declining enrollment.

1. Methodology

Data Sources

Geographic Map Data

Five (5) geographic data layers were modified or created for use in the ten-year student population forecasts:

STREET CENTERLINE DATA/PARCELS

Street centerline/parcel data files are utilized during the geocoding process of the student data. The geocoding process places a point on the map for every student in the exact location where the student resides. Each student is geocoded to the parcels by their given residence address. This enables MGT to analyze student data geographically.

STUDY AREAS

Study areas are small geographic areas – such as neighborhoods or portions of neighborhoods – that are considered the building blocks of school district attendance areas. Study areas are geographically defined following logical boundaries within a school district, such as freeways, streets, railroad tracks, or green space. Each study area is then coded with the corresponding elementary, middle, and high school that the students in the area are assigned to attend. By gathering information about the district at the study area level, MGT and SRVUSD can closely monitor growth and demographic trends in regions and identify the potential need for boundary or facility adjustments. Currently, 627 study areas make up the school district.

SCHOOLS

School facility information, including school names, addresses, unique identifying codes, grade ranges, and capacities, was provided to MGT by district staff.

PLANNED RESIDENTIAL DEVELOPMENT

Residential development data was obtained through discussions with the local municipalities. MGT researched possible new developments that could impact future student counts and reviewed the information with school district staff. This data includes the development name, location, housing type, and the total number of units within the development. The planned residential development information is subject to changes in the marketplace; therefore, this data should be reevaluated annually. MGT and San Ramon Valley Unified School District were monitoring projects closely during this study.

STUDENT DATA

HISTORIC STUDENT DATA - Historic population data is used to compare past student population trends as well as the effects of mobility (movement of students in or out of existing housing) throughout the district.

CURRENT STUDENT DATA - A student data file representing student membership as of School Year 2025 was provided to MGT by district staff. This data was summarized by grade level and each student was located by residential address to identify current study area populations. This data is used as a baseline for student population forecasts. The forecasts encompass the next ten years from SY2025/26 through SY2035/36.

Forecast Methodology

MGT has created ten-year, residence-based, modified cohort forecasts for each study area in SRVUSD. The forecast methodology used in this study combines historic student population counts, past and present demographic characteristics, and planned residential development to forecast future student populations at the study-area level. District-wide and school-level forecasts are summarized from the individual study area forecasts.

RESIDENCE-BASED

These forecasts are based on where the students reside and where they are assigned to attend school. To provide the most accurate estimate of where future school facilities may be needed, MGT uses the location of where the students reside as opposed to their school of enrollment because we believe that school facility planning is more accurate when facilities are located where the greatest number of students reside. The best way to plan for future student population shifts is to know where the next group of students will be living.

Typically, district-generated forecasts are based on school enrollments and are forecasted for staffing and budgetary needs. However, this method is often inadequate for long-range planning needs, such as the location of future school facilities, because the location of the students is not taken into consideration. A school's enrollment can fluctuate annually not only due to population trends but also due to variables in the curriculum, program changes, school administration, and open-enrollment policies. These variables can skew the apparent need for new or additional facilities in an area.

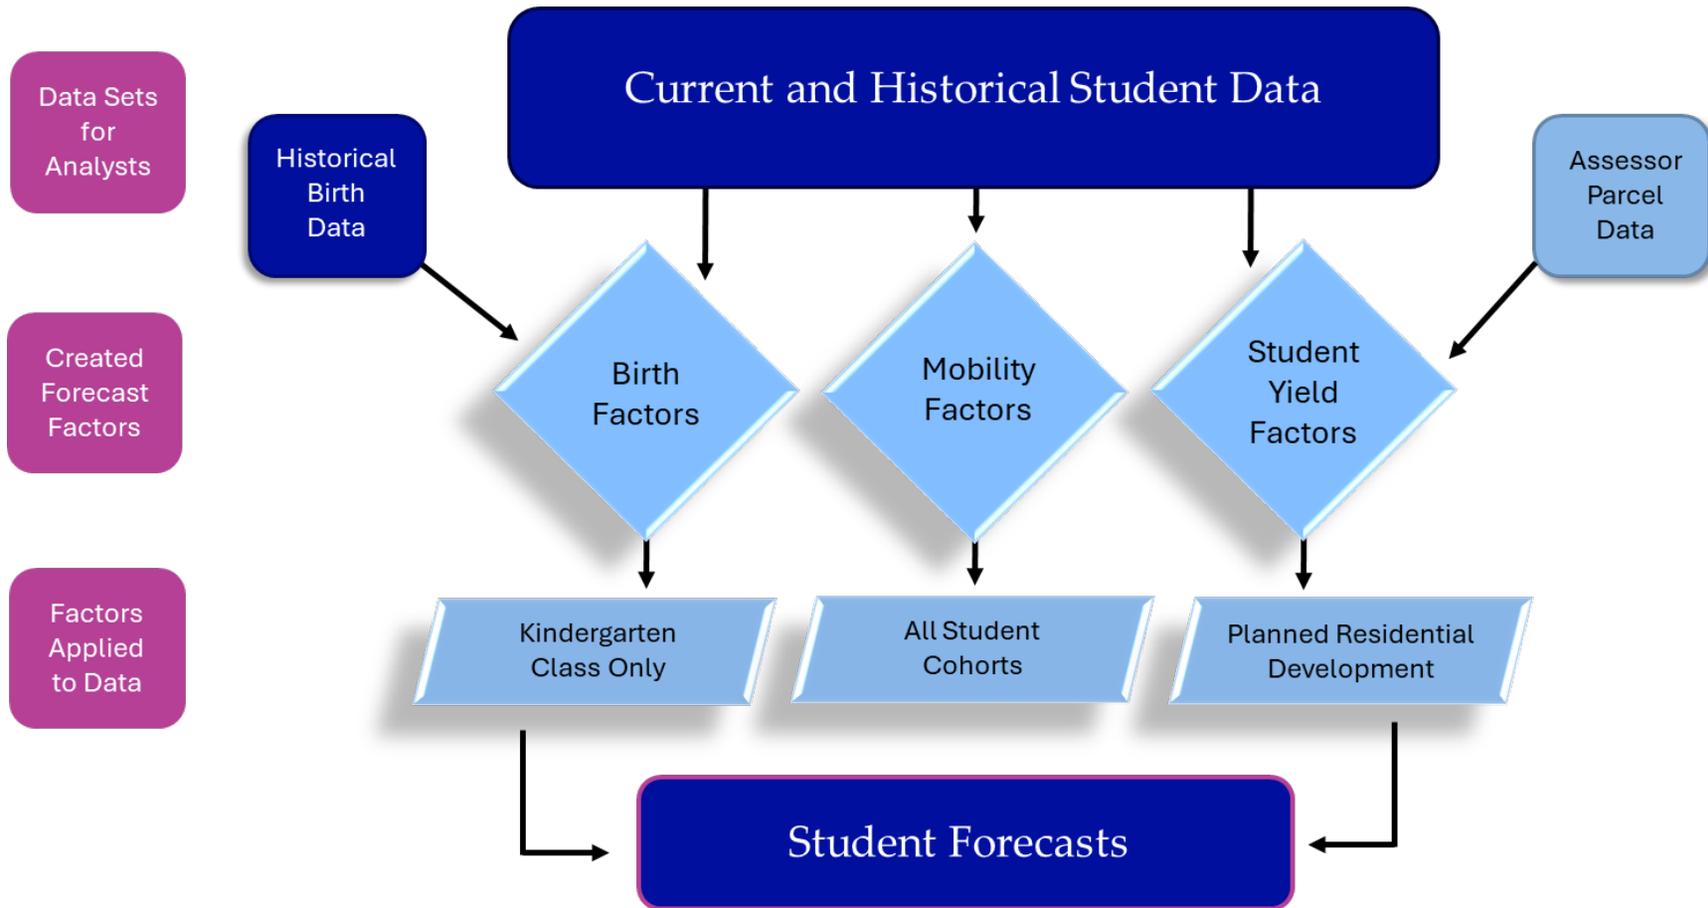

MODIFIED COHORT

The method used by MGT is unique because it modifies a standard cohort forecast with demographic factors and student residential location. For each year of the forecast, 12th grade students graduate and continue students' progress through to the next grade level. This normal progression of students is modified by the forecast variables detailed below.

TEN-YEAR FORECASTS

Projections are calculated ten years from the date of the forecast for several reasons. The planning horizon for any type of facility is typically no less than five years, often longer. Ten years is usually enough to adequately plan for any new facility. Forecasts beyond ten years are based on speculation due to the lack of reliable information on birth rates, new home construction, and economic conditions.

Chart 1: Forecasts by Residence Flowchart

Forecast Factors

There are three primary factors that can directly influence a forecast: birthrates, mobility, and student yield factors. If all factors register at a lower level, they suggest a decrease in the district's population. Conversely, higher factors typically signal growth within the district. Frequently, it's a blend of both scenarios. For instance, national birth rates may be on the decline, but a district can maintain stability or expansion by fostering adequate development to counterbalance the decreasing birth trend.

Birth Rates

MGT uses birth data correlating to the district boundary and applies the data accordingly. The assumption underlying the use of birth statistics from year to year is that increases or decreases in the number of births in the area will translate to increases or decreases in future kindergarten enrollment. For example, the SY2025 kindergarten class in SRVUSD was born five years previous in 2020. Any subsequent changes in births in 2021 compared to 2020 and 2022 to 2020, etc. would result in similar increases or decreases in future kindergarten class sizes.

In calculating birth rates, the capture rate of births is also taken into account. This consideration is crucial for assessing whether the current kindergarten class size is an anomaly. Should it be determined that the class size is atypical, future estimated capture rates can be adjusted to eliminate errors resulting from unusually high or low enrollment figures in kindergarten.

CHART 2: CAPTURE RATE OF BIRTHS IN SAN RAMON VALLEY UNIFIED SCHOOL DISTRICT

Student Mobility Factors

Student mobility factors further refine the student population forecasts. Mobility refers to the increase or decrease in the movement of students within and out of the district boundary’s existing housing. Mobility is a spatial cohort survival rate meaning that it calculates the movement of students from grade in that geographic area. Mobility factors consider apartment movement, housing resales, foreclosures, movement to non-district schools, early graduation, and high school dropout rates. Mobility, like a cohort, is applied as a percentage of increase/decrease to each grade for every year of the forecast.

Mobility is calculated using four years of student data. MGT uses current elementary school attendance areas as the basis to calculate Mobility Factors. Using small geographic areas helps identify and focus on trends within the district. A net increase or decrease of zero students over time is represented by a factor of **1.00** or a 100% pass-through rate. A net student loss is represented by a factor less than 1.000 (such as **.96** or a -4% net loss) and a net gain by a factor greater than **1.00** (such as **1.05** or a 5% net increase).

HOW IS MOBILITY APPLIED?

$$\begin{array}{rcl}
 & 100 & \text{Kindergarten students in SY2025-26} \\
 \text{Example: } \mathbf{X} & \mathbf{1.02} & \text{(Alamo ES ES 1}^{\text{st}}\text{-grade mobility)} \\
 = & 102 & \text{1}^{\text{st}}\text{-grade students in SY2026-27}
 \end{array}$$

Student Yield Factors (SYF)

The Student Yield Factors, when applied to planned residential development units, determine how many additional students will be generated from new construction within the district.

Two sets of data are required to calculate Student Yield Factors: a current student file provided by SRVUSD and current housing unit data. In a full SYF Study, the geocoded student data file is overlaid with the housing data to determine how many students reside in each housing type. This allows MGT to associate each student with a specific housing unit. A full SYF study is recommended every 2-5 years depending on the amount of residential growth of the district, the economy or life altering events, such as a pandemic.

The SYF is an important tool for school districts to use in planning for future enrollment growth. By knowing the SYF for different types of housing, districts can get a better idea of how many students they can expect to enroll in the future. This information can be used to make decisions about staffing, facilities, and programming.

The Student Yield Factor (SYF) for San Ramon Valley Unified School District measures the number of school-aged children residing in housing units built within the last five years. The following student yield factors were provided by SRVUSD and applied to the resident student population forecasts. A sampling of the Pleasanton USD Transit-Oriented Development TOD was applied to planned residential development within the Bishop Ranch area which represent the first set of TOD units that will get built within the district boundary. These factors were last updated in fall 2024.

TABLE 3: STUDENT YIELD FACTORS

	K-6	7-8	9-12
Single Family Detached	0.31	0.11	0.27
Single Family Attached	0.31	0.10	0.22
Multi-Family	0.24	0.07	0.16
TOD - Pleasanton	0.114	0.033	0.049

Planned Residential Development

Closely related to the Student Yield Factors are planned residential development units. Planned residential development data is collected to determine the number of new residential units that will be built over the time frame of the student population forecasts. MGT collected information from city planning departments as well as project developers regarding planned or active construction. Currently, there are 44 active or planned projects in San Ramon Valley Unified School District, totaling 5006 units included in the forecast over the next ten years.

2. Student Information

The forecast relies on student data as its cornerstone. Initially, we gather the latest four years of student information. Engaging in quality checks, including verification through Student Verification forms, we collaborate closely with the district to validate the accuracy of the acquired data. Subsequently, we move on to geocoding the students based on their home addresses. This process allows us to conduct spatial analyses such as creating a Student Density map, Attendance Matrices, and ultimately generating the Student Forecast.

TABLE 6: STUDENT ACCOUNTING SUMMARY

The Student Accounting Summary indicates the total student enrollment as of 10/1/2025, and the number of students used in the resident student forecast. The forecast model is based upon student residence and excludes students residing outside of the district boundaries and students with addresses that are not matched during geocoding. The forecast also may exclude other groups of students indicated in the summary below.

Student Accounting Summary School Year 2025/26	
Student data captured on: 10/1/2025	
Students in Forecast	
General Education Students	27,385
Total Students in Forecast	27,385
Students Not in Forecast	
Inter-District Students	420
Other Students	240
Total Students Not in Forecast	660
Total Students in District Summary	
Total Students in Forecast	27,385
Total Students Not in Forecast*	660
San Ramon Valley Unified District 2025/26 Enrollment	28,045

Map 2: Resident Student Density SY 2025/26

Attendance Matrix

An attendance matrix is included to clarify where students live versus where they attend school. It's important to note that MGT bases its forecasts on students' residences rather than their current school enrollments. This approach allows for the most accurate predictions of student population shifts and the optimal locations for future facilities, if needed. As a result, the resident forecast figures for each school may differ slightly from the actual reported enrollment. Given that programs and policies can change, the most effective way to plan for future facilities is by understanding where the upcoming student populations reside, rather than focusing solely on their current school enrollments.

Attendance matrices serve as a check and balance for student accounting by showing where students reside (their School of Residence) based on their geocoded addresses and where they attend (School of Attendance) according to district-provided data. This comparison is crucial for ensuring that the students included in the forecasts align with the district's enrollment records for each school. Additionally, by comparing School of Residence data with School of Attendance data, intra-district transfer patterns can be identified. The student counts in the matrix reflect SRVUSD's enrollment as of the 2024 school year.

Reading the Matrix

The rows of the attendance matrix represent students living within each attendance area, while the columns show the number of students attending each school. As you read across a row, you'll see which schools the students from that attendance area are attending. Reading down a column reveals where the students attending that school live.

For example, on 10/1/2025, Alamo ES Elementary School had 333 students residing in its attendance area. Of those, 302 attended Alamo ES Elementary, 2 Bella Vista ES Elementary, and so on. In the column labeled Alamo ES, the total at the bottom shows that 330 students are enrolled there. Beyond the 333 who live in the Alamo ES Elementary attendance area, no students reside in the Bella Vista ES Elementary attendance area, 0 in the Bollinger Elementary attendance area, and so forth. Additionally, 10 students enrolled at Alamo ES Elementary School live outside the district boundary.

3. District-Wide Student Population Forecasts

The student population is forecasted out ten years for each of the study areas, attendance areas, and for the entire San Ramon Valley Unified School District. The district-wide summary enables the district to see a broad overview of future population shifts and what effect these shifts may have on existing and future facilities. Each attendance area is summarized to give a local view of population changes and identify variances within the district.

Together, these forecast summaries present the means for identifying the timing of future population shifts and overall facility adjustments needed to accommodate these shifts. Study areas and their forecasted resident students can be shifted between schools to assist in balancing enrollment through boundary changes, grade-level reassignments, or other means identified to better utilize school facilities. Forecasts provided in this report are based on students who live in the district School Year 2025.

Forecast Trends

The building blocks of the forecasts are the individual study areas. There are currently a total of 627 study areas in the San Ramon Valley Unified School District. The attendance areas and district summary are simply the compilation of all the study areas. For each study area, the student counts are forecasted over ten years (Current: SY2025/26; Forecasted: SY2025/26 through SY2035/36).

Districtwide enrollment is projected to decline steadily over the next decade, falling from 27,805 students in 2025 to approximately 23,312 students by 2035—a reduction of about 16%. The forecast shows consistent year-over-year losses, with annual decreases ranging from roughly 160 to nearly 600 students. This downward trend appears across nearly all grade levels, reflecting smaller incoming cohorts and a shrinking student population. The reduction is driven primarily by declines in resident enrollment.

All three major grade configurations TK–5, 6–8, and 9–12 show predicted reductions in enrollment. The middle school grades (6–8) show the sharpest forecasted decline at roughly 21%. Elementary grades (TK–5) are projected to fall by about 13%, while high school enrollment is expected to decrease by approximately 17%. These patterns indicate a sustained contraction of the student population moving up through the system, with no grade span showing signs of recovery within the ten-year window.

3. DISTRICT-WIDE STUDENT POPULATION FORECASTS

CHART 3: CURRENT AND FORECASTED TRENDS SY20255-SY2035

Map 2 : Forecasted 5-Year Change in Resident Students

The study areas within the color range are the planning areas that make up the titled attendance zone. Red/orange areas indicate forecasted student growth, and the green areas represent areas in decline. The gray zones represent “No Change” and frequently have little to no population. Data is based on School Year 20255 resident students and their existing zones. This map does not reflect any rezoning or changes since fall student report to state department of education.

5. Enrollment Forecasts

District-generated forecasts are essential for estimating staffing and budget needs based on overall school enrollments. However, relying solely on these forecasts for addressing capacity issues presents several challenges, particularly for long-term planning. One key limitation is that these forecasts focus on total enrollment rather than the distribution of students across specific areas, making it difficult to account for spatial population trends and future facility demands.

Annual enrollment changes, influenced by factors like curriculum shifts, program offerings, administration changes, and open-enrollment policies, add complexity to forecasting, creating uncertainties around facility needs in particular areas. Short-term solutions, such as shifting grade configurations, may provide temporary relief but often disrupt educational continuity and logistics, failing to address long-term capacity challenges sustainably.

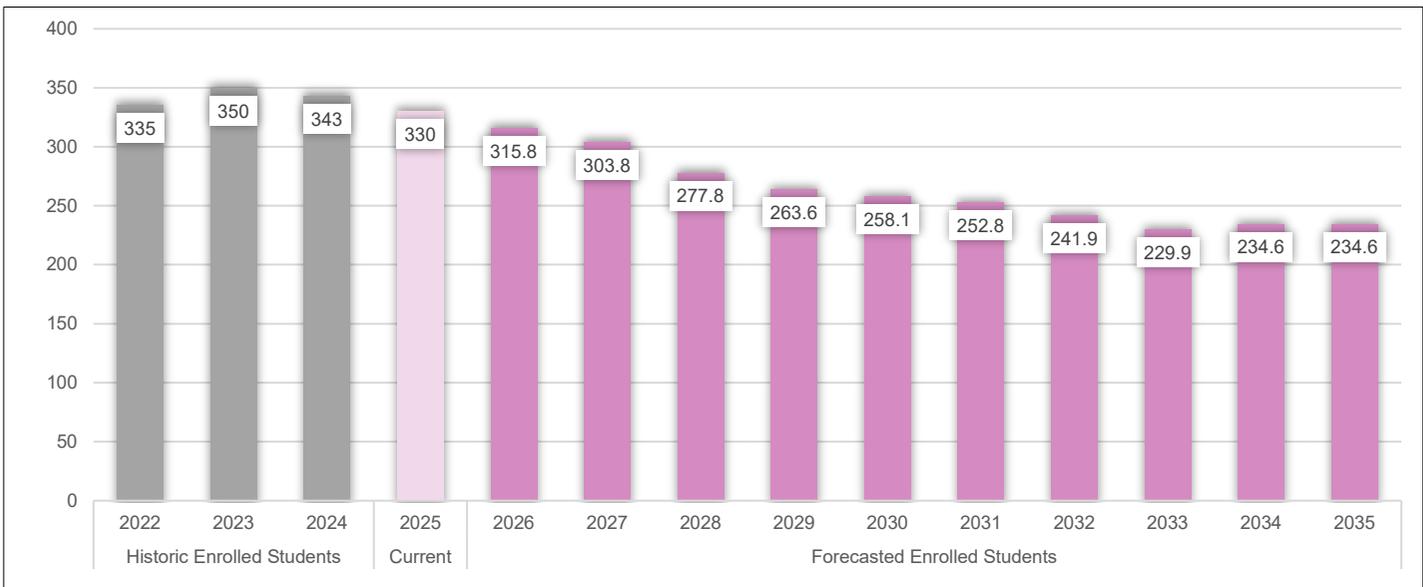

In summary, relying solely on district enrollment forecasts, especially with short-term measures, can lead to inaccuracies in assessing facility needs and planning for the future. These forecasts should be used primarily for staffing insights and not as a basis for facility planning.

Appendix A: Census Data

DEMOGRAPHIC AND INCOME PROFILE PROVIDED BY CENSUS

Data provided on the following pages is based on geographically related information from San Ramon Valley Unified School District based on a third-party source using Esri analytics in combination with Census information and American Community Survey. This information is provided by MGT as supplemental information about the district. MGT did not research nor guarantee the accuracy of the Census data. Demographic and Income Profile Provided by Census.

METHODOLOGY STATEMENT

- **Demographic and Income Profile / Community Profile:** Esri forecasts for 2025 and 2030. Esri Updated Demographics are point estimates representing July 1 of the current and forecast years. The following table summarizes the updated demographic variables. Also included are select averages, medians, aggregates, and per capita values.
- **American Community Survey (ACS) Housing Summary:** Esri provides reports, data enrichment, and thematic mapping for ACS estimates in standard geographies, current ZIP codes, and user-defined polygons. Reports include two summary profiles, Population, and Housing. Esri's reports/maps are designed to simplify the data and enhance its usability with reliability thresholds. ACS data provide much of the information previously available through the decennial census. ACS uses a continuous measurement or "rolling" sample, in which a small percent of the population is sampled every month. The ACS is updated and released more frequently than the decennial census—every year instead of every ten years. Smaller sample sizes and variable collection times have introduced a margin of error into their estimates.
- **Tapestry Segmentation:** provides an accurate, detailed description of America's neighborhoods—U.S. residential areas are divided into 67 distinctive segments based on their socioeconomic and demographic composition—then further classifies the segments into LifeMode and Urbanization Groups. Each year, the population and household count by Tapestry segment are updated. While most geographic areas retain their original Tapestry Segment assignment, select areas may be assigned a new market segment when research uncovers new or significant local growth. The entire Tapestry Segmentation system is refreshed every three to five years, resulting in a more comprehensive reassignment in rapidly changing neighborhoods. Tapestry is a geodemographic segmentation system that integrates consumer traits with residential characteristics to identify markets and classify US neighborhoods. Neighborhoods with the most similar characteristics are grouped together, while neighborhoods with divergent characteristics are separated. Internally homogenous, externally heterogeneous market segments depict consumers' lifestyles and life stages. Tapestry Segmentation combines the "who" of lifestyle demography with the "where" of local geography to create a classification model with 67 distinct, behavioral market segments.

Data Note: N/A means not available.

2019-2023 ACS Estimate: The American Community Survey (ACS) replaces census sample data. Esri is releasing the 2019-2023 ACS estimates, five-year period data collected monthly from January 1, 2019 through December 31, 2023. Although the ACS includes many of the subjects previously covered by the decennial census sample, there are significant differences between the two surveys including fundamental differences in survey design and residency rules.

Margin of error (MOE): The MOE is a measure of the variability of the estimate due to sampling error. MOEs enable the data user to measure the range of uncertainty for each estimate with 90 percent confidence. The range of uncertainty is called the confidence interval, and it is calculated by taking the estimate +/- the MOE. For example, if the ACS reports an estimate of 100 with an MOE of +/- 20, then you can be 90 percent certain the value for the whole population falls between 80 and 120.

Reliability: These symbols represent threshold values that Esri has established from the Coefficients of Variation (CV) to designate the usability of the estimates. The CV measures the amount of sampling error relative to the size of the estimate, expressed as a percentage.

- **High Reliability:** Small CVs (less than or equal to 12 percent) are flagged green to indicate that the sampling error is small relative to the estimate and the estimate is reasonably reliable.
- **Medium Reliability:** Estimates with CVs between 12 and 40 are flagged yellow. Use with caution.
- **Low Reliability:** Large CVs (over 40 percent) are flagged red to indicate that the sampling error is large relative to the estimate. The estimate is considered very unreliable.

Data Note: This report identifies neighborhood segments in the area, and describes the socioeconomic quality of the immediate neighborhood. The index is a comparison of the percent of households or Total Population 18+ in the area, by Tapestry segment, to the percent of households or Total Population 18+ in the United States, by segment. An index of 100 is the US average.
